Modeling and First Findings

Outlook

# Introduction

## The SUNDISC cycle

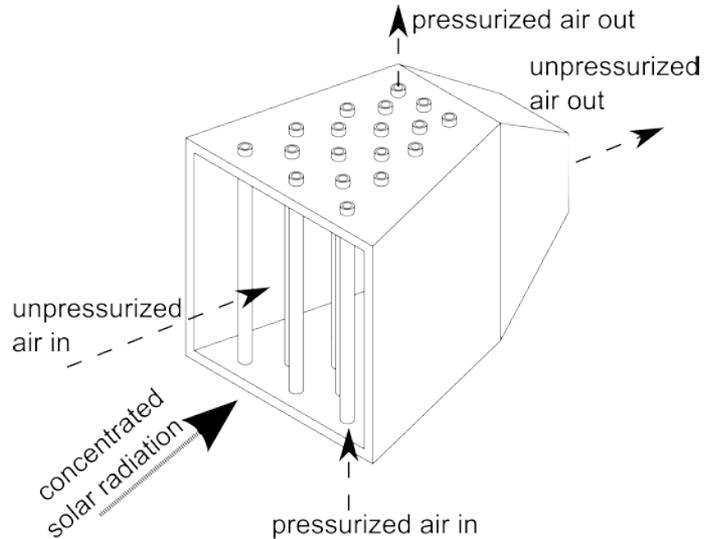

- high cycle efficiency
- low co-firing rates
- 'baseload' characteristics
- cost-effective rock-bed TESS
- high capacity factor of pressurized receiver system

# Introduction

## The HPAR concept

- tubular metallic absorber
  - $T_{\text{out,max}} \approx 800 \text{ }^\circ\text{C}$
- ‘macro-volumetric’ effect
- dual-cooling of absorber

Outlook

# Implementation

## Flow path

SOLGATE receiver system (Buck, 2003)

# Implementation

## Boundary conditions for HPAR system (5 MW<sub>e</sub> GT)

- $\dot{m}_{\text{press. air}} = 20.5 \text{ kg/s}$
- $p_{\text{in}} = 14.7 \text{ bar}$
- $T_{\text{in}} = 400 \text{ °C}$
- $T_{\text{out}} = 800 \text{ °C}$
- $\dot{Q}_{\text{press. air}} = 9 \text{ MW}_t$
- $T_{\text{tube,max}} = 950 \text{ °C}$
- $\Delta p_{\text{HPAR,max}} = 100 \text{ mbar}$

Outlook

# Modeling and First Findings

## Optics – Modeling

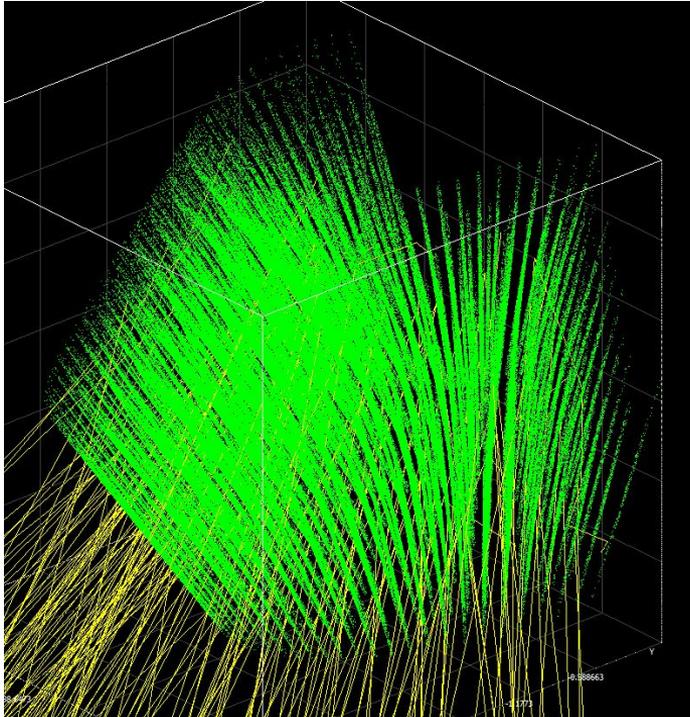

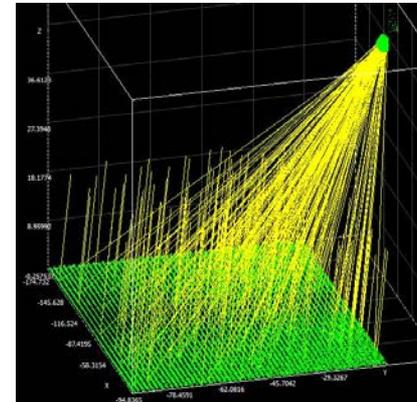

Photo of Sierra SunTower (adapted from Schell, 2011)

Visualization of hit points from  
HPAR ray tracing simulation

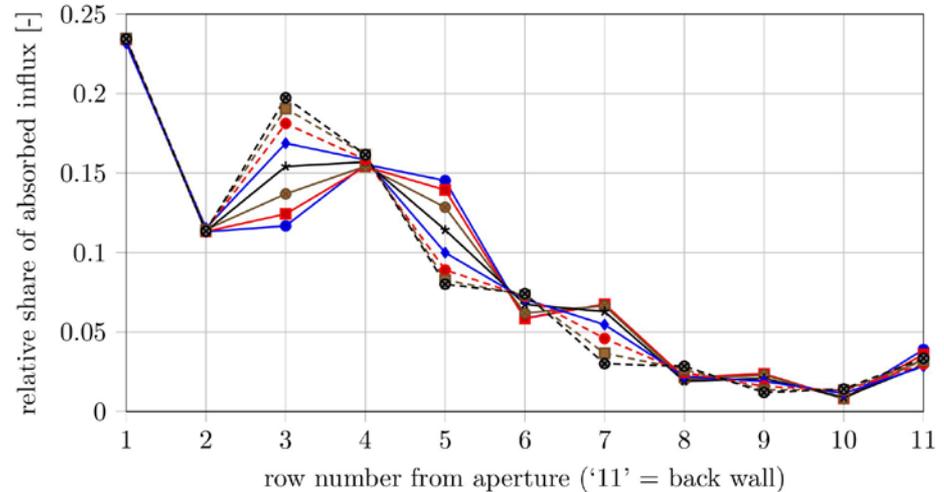

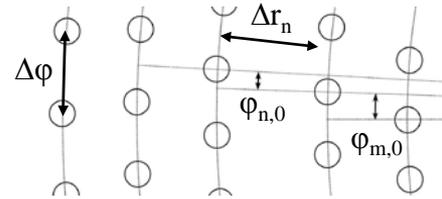

# Modeling and First Findings

## Optics – Findings

- flux distribution greatly influenced by tube layout
  - angular offset  $\varphi_0$
  - distance  $\Delta r / \Delta\varphi$
  - receiver tilt
  - wall design/properties
  - (solar field/sun position!)

flux penetration for differing angular offset between rows '2' and '3'

# Modeling and First Findings

## Thermal radiation – Modeling

Assumptions:

- infinitely long tubes
- same  $T$ -profile per row
- for radiation: tube has binary  $T$ -profile (front/back)

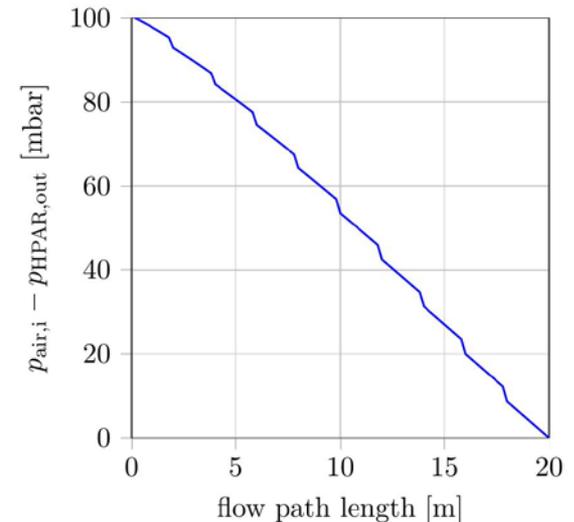

More detailed thermal radiation model should be applied (see Section ‘Outlook’)

# Modeling and First Findings

## Flow in tubes – Modeling

- Gnielinski correlation enhanced for circumferentially changing flux after Reynolds (1963) and Gärtner et al. (1974)
- chosen:  $D_i = 25 \text{ mm}$  /  $L_{\text{tube}} = 2 \text{ m}$  /  
 $n_{\text{rows}} = 10$  (in series)
  - >  $U_{\text{mean}} = 15 \text{ m/s}$
  - >  $Re_{\text{mean}} = 40\,000$
  - >  $\dot{m}_{\text{max}} = 0.03 \text{ kg/s}$  (per flow path/column)
  - >  $Nu_{\text{mean}} = 83$  /  $h_{\text{mean}} = 30 \text{ W}/(\text{m}^2 \text{ K})$

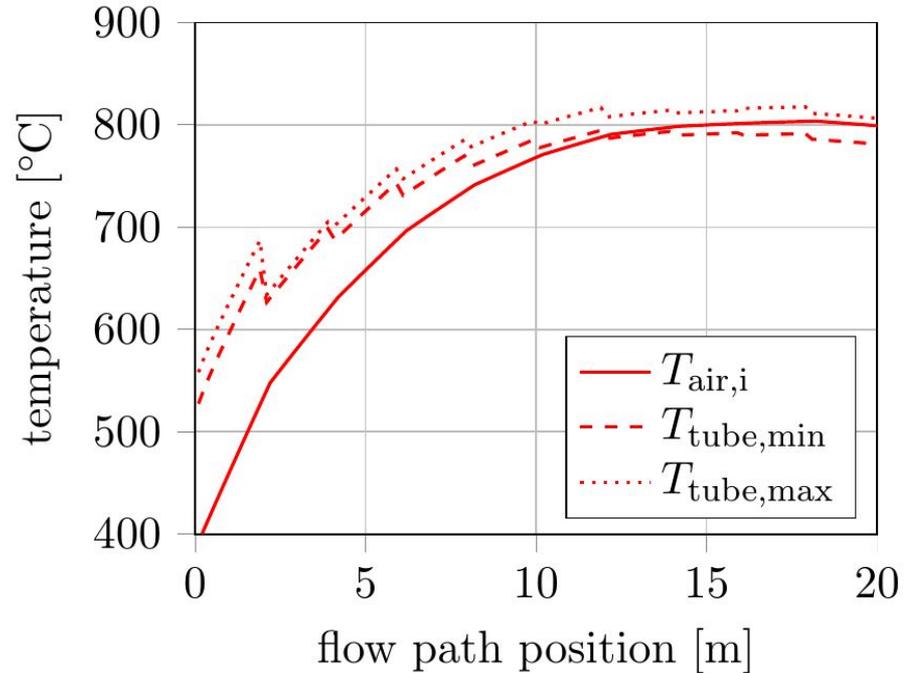

# Modeling and First Findings

## Flow in tubes – Findings

- serial flow path leads to low flow velocity and heat transfer
- $\dot{Q}_{Re} = 1.11 \text{ MW}_t$

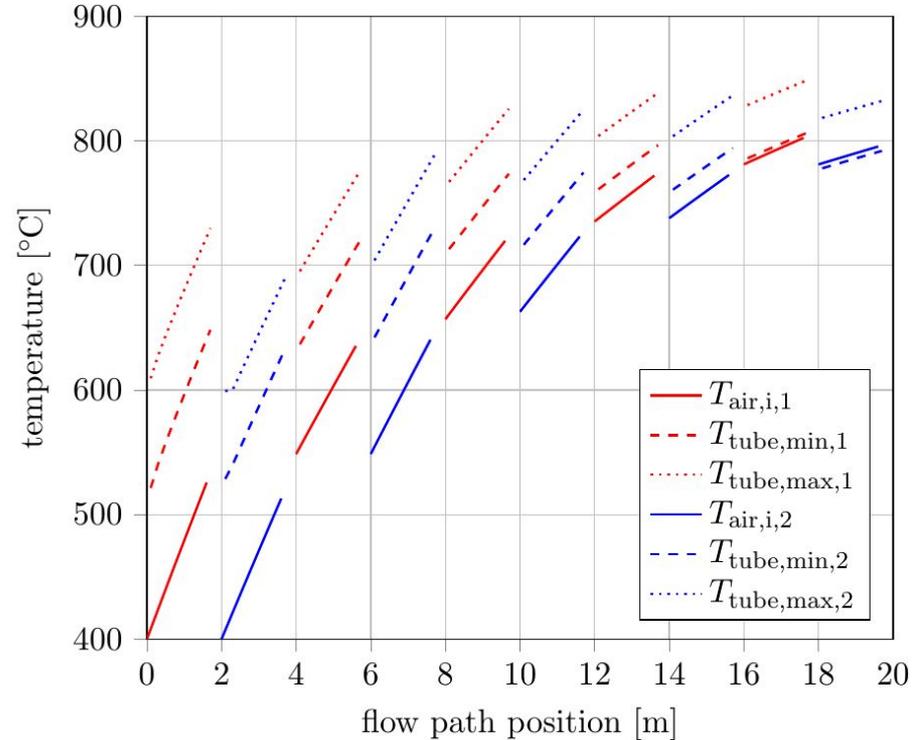

# Modeling and First Findings

## Flow in tubes – Double flow path

- partially parallel flow paths appears more favorable
- however, larger temperature difference occur between tube and air for higher air velocity
- $\dot{Q}_{Re} = 3.49 \text{ MW}_t$

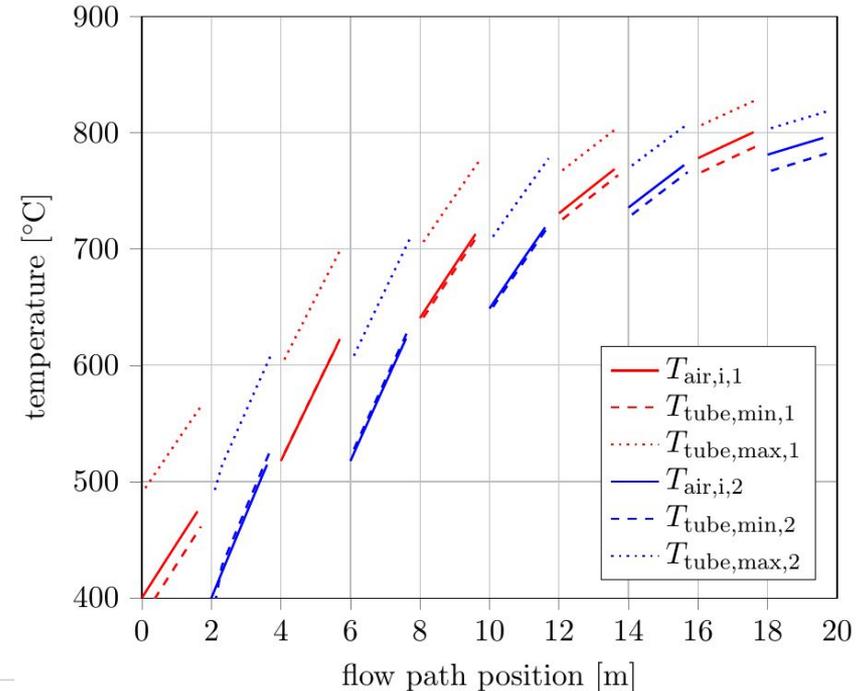

# Modeling and First Findings

## Flow in tubes – Heat transfer enhancement (HTE)

- temperature difference between absorber (front) and air can be lowered by increasing heat transfer through HTEs at the cost of higher friction factors
- Chen et al. (2001) recommend dimples, Uhlig et al. (2015) tested corrugated tubes
- $\dot{Q}_{Re} = 4.13 \text{ MW}_t$

# Modeling and First Findings

## Flow around tubes – Modeling

- so far heat transfer modeled as flow around individual tubes only
- more detailed (3-D) model will be build in CFD
- For  $U_{\text{mean},o} = 4 \text{ m/s}$ 
  - $Nu_{\text{mean},o} = 20$
  - $\Delta T_{\text{air},o} = 35 \text{ }^\circ\text{C}$
- For  $U_{\text{mean},o} = 0.4 \text{ m/s}$ 
  - $Nu_{\text{mean},o} = 6.3$
  - $\Delta T_{\text{air},o} = 102 \text{ }^\circ\text{C}$
- wanted:  $\Delta T_{\text{air},o} > 400 \text{ }^\circ\text{C}$

# Modeling and First Findings

## Flow around tubes – Findings

- heat transfer in tube bundle too poor to heat up considerable amount of air to desired temperature
- at lower velocities, wind will be problematic
- more elaborate modeling necessary but not expected to change the heat transfer to the needed extend
- external HTE or additional volumetric receivers at the inner wall are conceivable

Introduction

Implementation

Modeling and First Findings

Outlook

# Outlook

- A CFD model will be created to conduct more detailed simulations of thermal radiation, heat transfer under circumferentially inconstant flux and heat transfer from the tube bundle to the unpressurized air stream
- additionally to the basic layout, the following enhancements will be investigated:
  - external HTEs
  - quartz glass inserts for radiation distribution and flow improvement

# Thank you!
