6. Performance prediction

Performance prediction for reference geometry:

	reference geometry	improved geometry
$\mathcal{T}_{air,out}$	801 °C	800 °C
$\Delta \boldsymbol{\rho}$	38 mbar	126 mbar
$\eta_{ m solar-thermal}$	85.2 % (9.5 % + 5.3 %)	86.7 % (9.1 % + 4.2 %)
$\Delta T_{air-wall}$	86 K - 136 K	65 K - 92 K
\mathcal{T}_{tip}	949 °C	874 °C
$T_{\rm root}$	887 °C	864 °C

lspike

7. Conclusion

- SCRAP receiver technology appears a viable technology for pressurized air applications
- Spike tip capable of coping with high flux
- Performance prediction values appear promising
- Pressure drop over a spike / receiver system is moderate
- Exploitation of volumetric effect appears somewhat successful (low radiative heat loss at cost of vulnerability to convective heat loss)

5th Annual STERG SolarPACES Symposium STELLENBOSCH, SOUTH AFRICA 13 - 14 JULY 2017

7. Further work

- Testing of a spike cluster exposed to radiation
- Improve model to represent circumferentially varying conditions
- Investigate helically swirled fins
- External CFD model of receiver to investigate wind and convection effects
- Detailed CFD modeling of spike tip and development of improved spike tip geometry
- Material and manufacturing considerations

5th Annual STERG SolarPACES Symposium STELLENBOSCH, SOUTH AFRICA 13 - 14 JULY 2017

Thank you.
